

EuroDaT

Gaia-X-based data trustee

The goal of EuroDaT is to establish a neutral data trustee in line with the EU's Data Governance Act and to implement Gaia-X-compatible exemplary use cases in a timely manner. The newly established frameworks create opportunities to develop and implement innovative products and promising business models.

EuroDaT aims to enable companies, science, and public authorities to merge data efficiently, securely, legally compliant and largely automatically and make it accessible for collaborative analysis. In this way, so-called data silos, which cannot be shared for reasons of data protection or antitrust law, for example, can be made accessible for consolidated analyses by the data providers or third parties. This is based on state-of-the-art technologies combined with the latest legal developments. The outcome is a neutral, transaction-based data trustee that decouples the data providers, the analyses conducted on encrypted data, and the recipients of the results.

In order to define the requirements for EuroDaT and the underlying procedural, technological and legal solutions, four use cases are being researched in detail: the development of a cross-bank transaction data analysis for the detection of fraud and financial crime, the determination of sustainability ratings for companies, a household dashboard for real-time consumption and savings behaviour of German households, and a system for providing government data, microdata for research purposes.
